# BuckTrace

## Dollar Bill Scanner for iOS & Android

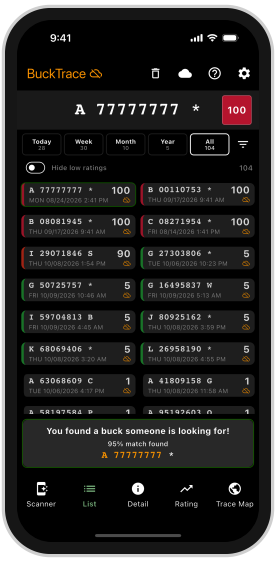

### OVERVIEW

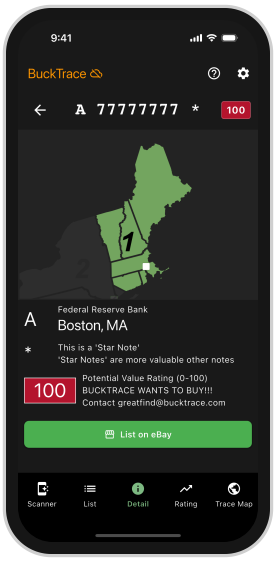

Fancy serial numbers slip by every day because checking bills by hand is slow and most people don't know what to look for. The BuckTrace mobile app reads the serial number on a $1 bill through the camera, rates it from 1–100, and saves where it was found. Scans work offline and sync to the cloud once you're signed in, so every buck you find adds a stop to its traced journey.

### TECHNOLOGIES USED

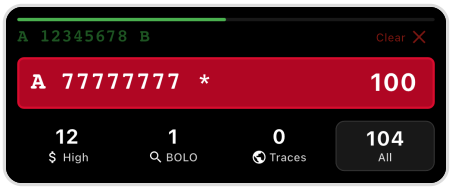

Flutter, Dart, Google ML Kit Text Recognition, Firebase (Auth, Cloud Messaging), Amazon AWS (Lambda, API Gateway), MongoDB, eBay Sell APIs, flutter_map, OpenStreetMap, Face ID / biometric sign-in

Start scanning right away, or explore without a camera: look up a serial by hand, browse signatures, or sign in to sync.

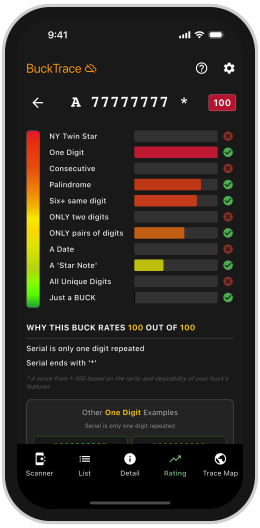

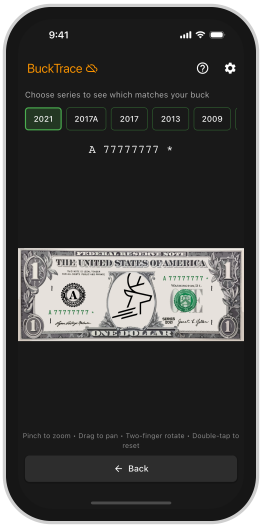

The scanner reads each serial several times over before locking it in, so a shaky hand doesn't save the wrong number. Every scan lands in your list with its rating, date, and sync status.

Tap a buck to see the Federal Reserve Bank that issued it and what it could be worth.

The Value Rating breaks down every pattern a serial matches, from star notes and palindromes to solid digits and dates. Pick a series to see your serial printed on a full-size bill with the matching signatures.

Each scan saves the GPS location where the bill was found. When someone else scans the same buck, the Trace Map draws a line to every stop it has made.

The BOLO (Be On the Look Out) marketplace connects collectors. Add up to 10 serials you want, and the app tells you when a scan matches someone else's list. Finds can be listed on eBay without leaving the app.
